

Strength Materials -1

Assignment in unit 4&5

1) The T section shown in Fig. is the cross-section of a beam formed by joining two rectangular pieces of wood together. The beam is subjected to a maximum shearing force of 60 kN. Show that the NA is 34 mm from the top and the $I_{NA} = 10.57 \times 10^6 \text{ mm}^4$. Using these values, determine the shearing stress (a) at the neutral axis and (b) at the junction between the two pieces of wood.

2) An I-section has the following dimensions: Flange: 2000mm x 25mm, Web: 250mm x 25mm. The maximum shear stress developed in the beam is 16.8 N/m². Find the shear force to which the beam is subjected.

3) Compute the midspan Deflection, slope at the supports for the beam loaded as shown in Fig.3 . Take EI is constant.

4) A horizontal steel girder having uniform cross-section is 14 m long and is simply supported at its ends. It carries two concentrated loads as shown in Figure 2. Calculate the deflections of the beam under the loads C and D. Take $E = 250 \text{ GPa}$ and $I = 150 \times 10^6 \text{ mm}^4$.

5) Find the angle of rotation and deflection at the free end of cantilever beam as shown in Fig
